Endpoint Readiness Checklists

EHR-connected workstation | Telehealth endpoint | Productivity device

Evidence rule: A PASS means the supplied evidence supports readiness for that item at the time checked. A FAIL identifies an unresolved condition. Intune compliance is supporting evidence, not proof that every local function works.

Checklist A | EHR-connected workstation

Item	PASS When	Escalate/Flag When
Managed-device identity	Correct synthetic device is identified and online.	Device mismatch, unknown device, or management state unavailable when required.
Compliance state	Organization-required compliance signal is Compliant where the device is Intune-managed.	Noncompliant/unknown, and policy requires compliant access; do not alter policy.
Time/date	System time is materially correct for sign-in and scheduled workflow.	Time skew is present, and the learner is not authorized to remediate.
Network reachability	Required services are reachable using the supplied course evidence.	Repeated or site-correlated failure; proxy/DNS/VPN/network evidence.
Epic client/session	Client launches and approved session check succeeds.	Repeated launch/session failure or application/service evidence outside Tier 1.

Checklist B | Telehealth endpoint

Item	PASS When	Escalate/Flag When
Microphone/speaker	Correct devices are detected, and the approved audio test succeeds.	Hardware/driver/managed restriction persists.
Camera	Camera is detected, and preview succeeds.	Hardware/driver/managed restriction persists.
OS/app permissions	Camera and microphone permissions required by the chosen Teams client/browser are enabled under approved procedure.	Managed or security-controlled setting cannot be changed by the user/Tier 1.
Teams client/browser path	Supported client/browser opens the virtual-visit path.	Client is unsupported, corrupted, or uses managed configuration blocks.
Meeting access	Current scheduled link reaches the intended meeting/join path.	Link mismatch, scheduling discrepancy, tenant setting, or service condition remains unresolved.
Connectivity observation	No supplied evidence indicates local/site network degradation.	Repeated drops, site correlation, reachability failure, or media-quality network evidence.

Checklist C | Productivity Device

Item	PASS When	Escalate/Flag When
Default browser/productivity app	Organization-approved app opens required non-clinical support content.	Managed application issue or unsupported version.
Printer/output path if used	Applicable output request reaches the expected downstream layer.	Shared queue/output service or persistent hardware/driver failure.
Peripheral readiness	Required headset/dock/display is detected and usable.	Persistent hardware or managed endpoint problem.
Storage/basic device health	No supplied course signal indicates local resource exhaustion affecting the workflow.	Resource exhaustion, device instability, or management action outside Tier 1.
