Health Information Management Access Validation Reference

Concepts + validation procedure for the coordinated case

Technical rule: Microsoft Entra group membership and Epic application authorization are separate states unless the organization's documented provisioning architecture explicitly maps them. Validate each layer independently.

Validation Sequence

Step	Validate	Evidence to Record	Tier 1 Boundary
1	Requester identity and role	Synthetic role label, ticket reference, organization-approved identity-verification result.	Do not request extra patient information to prove the support request.
2	Epic sign-in/session state	Whether authentication and the client/session succeed.	A functioning session does not prove record-level authorization.
3	Deployment-specific identity prerequisite	Entra group or other prerequisite only if the supplied architecture says it is used.	Do not add/remove group membership unless assigned authority exists.
4	Epic-side access state	Supplied Epic-side access/security artifact or organization-approved support reference.	Do not change Epic security class, template, provider config, or build at Tier 1 unless explicitly authorized.
5	Compare layers	Aligned/mismatched/not established.	Route the failed layer; do not force a root cause if evidence is incomplete.

Routing Logic

Observed State	Course Routing
Entra prerequisite missing; Epic-side state cannot be evaluated yet	Identity Administrators, if the deployment reference confirms Entra membership is a real prerequisite.
Entra prerequisite present; Epic-side access assignment missing	Epic Application/Analyst Team.
Both appear correct; chart still unavailable	Warm-transfer with evidence; do not invent a mapping or authorization defect.
Security/risk signal appears during access troubleshooting	Use the organization's identity/security escalation path rather than routine access handling.

Privacy Discipline

- Use the ticket reference and role labels in this synthetic course.
- For production support, follow role-based access, organization safeguards, and minimum-necessary policies where applicable.

- Role-label substitution is a course privacy-minimization convention, not a declaration that production data has been de-identified under HIPAA.

Epic-specific note: Epic customer build, security, client, and support procedures are organization-specific. The health system's approved Epic reference and Epic-provided customer documentation remain authoritative.
