Mock Coordinated Telehealth Support Ticket

Contoso Health | Synthetic training case | Ticket TH-2026-0907-01

Privacy rule: Synthetic data only. Do not add real patient or clinician identifiers to this exercise. Role labels and the ticket reference are sufficient for course traceability.

Ticket Snapshot

Field	Value
Ticket	TH-2026-0907-01
Opened	09:40 local time
Visit start	10:00 local time
Requester	Requesting nurse practitioner, Site Bravo outpatient clinic
Visit	Scheduled virtual follow-up
Reported impact	Potential delay to the virtual visit and pre-visit chart review
Support boundary	Use only the supplied evidence and approved Tier 1 course procedures; do not change tenant policy, Epic build, identity group membership, or scheduling integration.

Requester Statement

"I can sign in, but the scheduled patient chart is not opening normally. My camera is not available in the Teams pre-join screen, and the visit link I received is not taking me into the scheduled meeting. The visit starts in about 20 minutes."

Provided Evidence

Evidence ID	Synthetic Evidence Supplied to Learner
E1 | Epic client/session	Epic client launches successfully; user session is authenticated; non-chart navigation opens. Selecting the scheduled chart returns an access-related message. No customer Epic build change is permitted at Tier 1.
E2 | Identity prerequisite	The organization-specific provisioning map identifies Microsoft Entra group EHR-AMBULATORY-NP as a prerequisite for this deployment. The requesting NP is shown as a current member. This group state does not, by itself, prove Epic chart authorization.
E3 | Epic access artifact	The supplied mock Epic-side access artifact shows that the expected ambulatory chart-access assignment is not present for this synthetic user. Treat this as build/access evidence and route to the Epic application owner.
E4 | Endpoint state	Managed Windows workstation; Intune compliance state: Compliant. Device is online. Camera hardware is detected. OS camera permission for Teams is Off. Microphone and speakers are detected.

Evidence ID	Synthetic Evidence Supplied to Learner
E5 | Telehealth audio/video	Audio test: PASS. Video preview: FAIL before the approved local permission correction; PASS after correction. Do not infer network health from audio/video alone.
E6 | Meeting-access path	The current scheduling record contains join reference VA-90318-A. The link in the original clinician message contains VA-90318-B. The supplied course artifact marks VA-90318-B as superseded. This is scheduling/join-path evidence, not a Teams tenant-policy finding.
E7 | Service context	No supplied Microsoft 365 service-health advisory is correlated to this case. No broad multi-user impact is reported.

Expected Learner Decisions

- Component 1 | Epic client-side triage: Determine whether the evidence supports a client-side recovery path or an Epic-side access/build handoff.
- Component 2 | HIM access validation: Compare the deployment-specific Entra prerequisite and the Epic-side access artifact without treating Entra membership as equivalent to Epic authorization.
- Component 3 | Endpoint readiness: Apply the approved workstation/telehealth endpoint checklist and document the camera-permission correction only if the course procedure authorizes it.
- Component 4 | Telehealth checks: Record audio, video, device-permission, and meeting-access outcomes; use connectivity only as supporting failure-point evidence in this LC6 exercise.
- Warm transfers: Route by the failed layer and request one specific next action.
- Clinician communication: Choose proceed, delay, or reschedule based on the unresolved visit-blocking conditions. Do not promise a resolution time that is not supplied by the receiving team.
