Telehealth Pre-Session Check Procedure

Four graded checks + supporting connectivity observation

Scoring boundary: This project grades four pre-session checks: audio, video, device permissions, and meeting access. Connectivity is captured as supporting failure-point evidence rather than a fifth scored check in this case.

Pre-Session Sequence

Check	Tier 1 Verification	PASS Evidence	FAIL/Escalation Evidence
1 | Audio	Confirm selected microphone/speaker; run approved pre-join or device test.	Devices detected and audio test succeeds.	Device not detected, managed restriction, or Teams policy evidence blocks audio.
2 | Video	Confirm camera detection and preview.	Camera detected and preview succeeds.	Camera/driver/permission problem or effective policy/meeting option prevents video.
3 | Device permissions	Verify OS/browser/app camera and microphone permissions allowed by the approved user/Tier 1 procedure.	Required permissions enabled.	Managed/security control blocks change or required permission remains denied.
4 | Meeting access	Use the current scheduled join path. Confirm the clinician can reach the intended meeting state.	Correct current link reaches the intended meeting/pre-join state.	Link mismatch, scheduling discrepancy, service condition, or organization-managed Teams setting blocks access.

Supporting Connectivity Observation

- Record whether the supplied evidence indicates no issue, a single-device network issue, site-correlated degradation, or not-yet-established status.
- Do not diagnose the network root cause from one failed join attempt.
- Where available, use service-health and Teams call/meeting telemetry or the organization's approved network diagnostics.

Ticket Expected Evidence

Check	TH-2026-0907-01 Expected Evidence
Audio	PASS
Video	FAIL before approved camera-permission correction; PASS after correction
Device permissions	FAIL initially; PASS after approved local correction
Meeting access	FAIL because the supplied scheduling artifact shows the clinician has a superseded join reference
Connectivity	No supplied evidence establishes a local network failure
