Completed Case Report Example

Different synthetic scenario - reference only

VERSION	DATE	AUDIENCE
v1.0	2026-09-01	Learner-facing example

Do not copy: This example uses a different synthetic clinician and scenario. It demonstrates the evidence standard and structure, not a model answer to Dr. Chen's case.

Case: Dr. Patel - radiology curbside consult

A radiology physician at Contoso Health needs to provide a synthetic case summary to a partner-clinic physician and prepare a short administrative introduction. Tier 1 is asked to help with the Microsoft 365 workflow without taking ownership of clinical judgment, recipient authorization, or sending.

Component 1 - System Context and Dependency Analysis

Layer	Analysis
Clinical context	Synthetic radiology case summary originates from the clinician; Epic is context only and no direct Epic-to-Copilot integration is assumed.
Identity	Microsoft Entra ID authenticates the workforce identity and supplies the identity boundary for the Microsoft 365 workflow.
File collaboration	Synthetic case summary resides in an approved SharePoint team site and is shared using an authenticated recipient-specific route.
AI drafting	Microsoft 365 Copilot is used for administrative email drafting from supplied synthetic facts only.
Messaging	The clinician reviews and sends the final message through the approved Outlook workflow.
Failure boundary	If recipient authorization, sharing policy, or Copilot approval cannot be verified, Tier 1 stops and escalates.

Component 2 - Copilot Use Case Determination

Request decomposition: (a) draft a concise administrative introduction - Approved under KB-431; (b) summarize the clinical interpretation - Not approved for this exercise; (c) choose or authorize the

external recipient - Escalate to the clinician / approved privacy-security workflow; (d) send the final message - Clinician-owned.

Decision: Use Copilot only for the administrative drafting element. Do not place clinical interpretation or real patient data in the prompt.

Component 3 - Prompt Design and Verification

RCCOF prompt: Role: administrative communications assistant. Context: synthetic radiology case summary and approved partner-clinic introduction. Constraints: synthetic content only; no clinical interpretation; no recipient authorization decisions; do not send. Output Format: subject line plus concise email body.

Source-fact verification: The learner compared the draft against the synthetic source summary and confirmed that the purpose of the consult and file-sharing statement were supported. Policy verification: the phrase "recipient-specific sharing" was checked against KB-410, and the administrative-drafting classification was checked against KB-431.

Component 4 - End-User Guide

1. Open the approved collaboration location and confirm the synthetic file.
2. Review the current Manage Access state before sharing.
3. Use the authenticated recipient-specific sharing route required by the approved request.
4. Use Copilot only for the administrative email draft; do not include clinical interpretation.
5. Compare the draft against the source facts and the approved KB.
6. Review the recipient, link, permissions, and final message yourself before sending.
7. Stop and escalate if the recipient or sharing state is uncertain.

Privacy callout: A correct link is not enough. Confirm that the recipient is the intended authorized person before the file is exposed. Tier 1 explains the control; the clinician owns the disclosure decision.

Component 5 - Coaching Evidence

Decision point	Learner / clinician exchange
Copilot scope	Learner: "Let's separate the administrative drafting request from the clinical part. Copilot can help with the introduction; you keep the clinical interpretation with you." Clinician: "Understood - I'll keep the clinical reasoning out of the prompt."
Sharing boundary	Learner: "Before sharing, open Manage Access and confirm the recipient. I can walk you through the check, but I should not choose the recipient for you." Clinician: "I'll confirm the partner physician myself."

Final review	Learner: "Before you send, compare the draft to the source facts and verify the link and recipient." Clinician: "I'll do the final review and send it myself."

Reflection

The strongest coaching choice was keeping the two decision boundaries explicit: the Copilot task was administrative drafting, while clinical interpretation and disclosure authority stayed with the clinician. The moment that tempted me to take over was when Dr. Patel could not immediately find the Manage Access control. Instead of completing the change myself, I described the exact verification point and waited for the clinician to act. That preserved ownership while still reducing friction. A further improvement would be to establish the approved recipient and sharing state at the beginning of the coaching session so the final step feels like verification rather than a last-minute decision.

Example outcome: All five components are complete, evidence is traceable to the supplied synthetic references, and no real PHI is used.
