Technical Environment and Contoso Policy Fact Sheet

LC 4 simulation baseline

VERSION	DATE	AUDIENCE
v1.0	2026-09-01	Learner-facing

Use of this document: This fact sheet defines the simulated environment for LC 4. Treat these settings as Contoso policy and scenario assumptions, not universal HIPAA requirements.

System boundary

System / surface	Role in this simulation	What the learner may assume
Epic Hyperspace	Clinical workflow context	Epic is upstream clinical context only. No direct Epic-to-Copilot integration is established.
Microsoft Entra ID	Workforce identity and authentication	Identity evidence may include user identity, group membership, authentication methods, and Conditional Access results.
SharePoint / OneDrive	Approved file collaboration	The synthetic case file resides in an approved SharePoint team site and is managed through authorized Microsoft 365 collaboration surfaces.
Microsoft 365 Copilot	Administrative drafting assistance	Permitted only for the supplied administrative drafting use case and only with synthetic or otherwise approved data.
Outlook / Exchange Online	Human-controlled communication	Dr. Chen owns final recipient selection, message review, and send action.
Coursera AI	Simulated role-play participant	Used only with synthetic dialogue. It is not connected to the Contoso tenant or clinical systems.

Contoso policy baseline

Control	Simulation rule	Evidence expected
Copilot use	Administrative drafting only; no clinical advice, diagnosis, patient-specific reasoning, or autonomous disclosure decisions.	Approved-use-case citation + prompt + output review.

Input data	Synthetic content only for this course. No real PHI, credentials, tokens, secrets, or proprietary tenant data.	Completed AI Input Eligibility and Data-Minimization Checklist.
Prompt verification	Source facts are checked against the synthetic case summary; workflow/policy claims are checked against the mock KB.	Two verification references, with claim-to-source mapping.
External sharing	Use authenticated recipient-specific sharing. Anonymous / Anyone links are not part of the approved path.	Manage Access evidence and recipient confirmation.
Permissions	Do not broaden access to make the workflow work. Escalate when approval or inherited permissions prevent the approved path.	Ticket note + escalation route.
Tier 1 authority	Explain and verify; do not approve disclosure, change tenant-wide controls, or send clinical communications.	Scope statement and stop/escalate rationale.
Privacy escalation	Potential inappropriate use, disclosure, or data-policy issue follows the organization-designated privacy/security route.	Warm-transfer summary with minimum-necessary evidence.

Decision boundaries

- Clinical judgment remains with the clinician; Tier 1 does not decide whether the consultation itself is clinically appropriate.
- The learner may explain how to use approved Microsoft 365 controls but does not act as the disclosure approver.
- Microsoft platform configuration and tenant policy are separate from HIPAA legal determinations; a secure configuration does not by itself establish HIPAA compliance.
- When a Microsoft option is unavailable because of role, license, tenant policy, or product state, record Unable to Verify and escalate.
