Portfolio Brief Structure Reference

REFERENCE

Completed simulation sample for structural comparison - adapt it to your own evidence; do not copy

1 Situation Framing

This brief summarizes three simulated Tier 1 healthcare IT ticket case records. The work demonstrates authorized Microsoft identity support, Epic client-side triage, privacy-safe documentation, and scope-based escalation. Outcomes include both resolution and warm transfer.

2 Ticket Summaries

Identity access: Applied the approved verification procedure to a simulated Microsoft Entra account-access case, completed the scenario-authorized password-reset workflow, confirmed the result, and recorded no patient information.

EHR application: Applied approved client-side checks to a simulated Epic Hyperspace connectivity symptom. Documented the evidence and prepared a warm-transfer summary when the issue exceeded Tier 1 scope.

Privacy or security concern: Recognized a simulated concern involving patient information, stopped further unnecessary disclosure, preserved the required evidence reference in the authorized ticket process, and escalated through the scenario's approved incident path.

3 Technical Disciplines Demonstrated

Endpoint and Microsoft 365 support; service-desk documentation; EHR and clinical-application support; privacy, security, and escalation discipline.

4 Career Readiness Signals

- Applies approved Tier 1 verification procedures before taking action.
- Documents evidence, disposition, action, and verification outcome accurately.
- Protects patient information through minimum-necessary, privacy-safe documentation.
- Escalates through approved channels with completed checks, unresolved findings, and a specific request.

STRUCTURAL USE ONLY

Replace every detail with your own authorized evidence. A simulated case is not production employment. Do not include real patient information, credentials, or production screenshots.
