Career Readiness Portfolio Brief

Tier 1 healthcare IT support: target roles, resume evidence, portfolio cases, interview story

Candidate name	Primary target role	Location / target market	Portfolio version date
	Tier 1 Service Desk Analyst, regional health system		

Section 1: Target Roles and Sourcing Plan

TARGET-ROLE DECISIONS

Role	Type	Why this fits my evidence
Tier 1 Service Desk Analyst, regional health system	Primary	Matches my production Microsoft Entra ID and Microsoft 365 ticket work.
IT Help Desk Technician, hospital or ambulatory clinic group	Primary	Same evidence; smaller sites value Microsoft Intune device checks.
Clinical Applications Support Analyst, entry level	Stretch	Supported only by simulated Epic Hyperspace client-side triage.

EMPLOYER AND CHANNEL PLAN

Channel	Search terms / alert	Cadence
Career pages of three regional health systems in my target market	“service desk analyst”, “help desk tier 1”	Monday and Thursday
HIMSS JobMine	“healthcare IT support”	Weekly
LinkedIn and Indeed alerts	“Epic service desk”, “clinical help desk”	Daily; verify on employer site

THREE-WEEK EXPERIMENT

- **Week 1:** Run baseline searches on all channels and log which role titles return Tier 1 postings.
- **Week 2:** Drop low-yield titles, add keywords from strong postings, and submit five tailored applications.
- **Week 3:** Review responses, follow up once per application, and decide whether to continue, broaden, or narrow.

Section 2: Resume Evidence

PROFESSIONAL SUMMARY

Tier 1 healthcare IT support candidate targeting a regional health system service desk. Brings production IT support experience in Microsoft Entra ID and the Microsoft 365 admin center, extended through simulated clinical tickets covering Epic Hyperspace client-side triage. Documents with role labels and minimum-necessary detail, and routes suspected PHI exposure through the approved incident path.

EXPERIENCE BLOCK

IT Support Technician, Tier 1 | [Employer] | [Dates]

Context: Service desk for Microsoft 365 users in a non-healthcare environment handling confidential data; healthcare work is simulated and described in Section 3.

- **Account-access tickets:** verified caller identity under the approved procedure before resetting passwords in Microsoft Entra ID; confirmed sign-in and recorded the verification step.
- **Licence and mailbox requests:** assigned licences in the Microsoft 365 admin center within delegated permissions; escalated Conditional Access changes to the identity team.
- **Device compliance tickets:** reviewed compliance status in Microsoft Intune; warm-transferred unresolved cases to endpoint engineering with completed checks.
- **Confidential-data tickets:** wrote minimum-necessary notes with no credentials or customer identifiers; reported suspected exposure through the security incident path.

Section 3: Help Desk Resolution Portfolio Brief

SITUATION FRAMING

This portfolio contains three Tier 1 ticket case records produced in a simulated regional health system service desk environment. No production systems or real patient data were used. The records cover Microsoft identity support, Epic client-side triage, and a privacy concern, all handled within Tier 1 scope.

TICKET SUMMARIES

Ticket 1, Identity access. A clinical staff member could not sign in to Microsoft 365. I applied the approved identity verification procedure, completed the scenario-authorized password reset in Microsoft Entra ID, and confirmed successful sign-in. Disposition: Resolved, no patient information recorded.

Ticket 2, EHR application. A provider reported that Epic Hyperspace would not connect. I ran the approved client-side checks, documented each result, and found the cause sat outside Tier 1 scope. Disposition: Escalated by warm transfer to the application team, ownership confirmed.

Ticket 3, Privacy concern. A clinical staff member reported patient information visible in an unapproved location. I stopped further disclosure, logged an evidence reference instead of the content, and escalated through the approved incident path. Disposition: Escalated to the privacy office, ownership confirmed.

TECHNICAL DISCIPLINES DEMONSTRATED

- **Microsoft 365:** identity verification and password reset in Microsoft Entra ID within Tier 1 scope.
- **EHR-adjacent:** Epic Hyperspace client-side checks, with build-side issues routed to the application team.
- **HIPAA discipline:** role labels, minimum-necessary notes, and no PHI in plain text.
- **Warm-transfer awareness:** handoffs naming completed checks, the unresolved finding, and the requested action.

CAREER READINESS SIGNALS

- Verifies identity under the approved procedure before touching an account.
- Records action, evidence, disposition, and verification result.
- Replaces patient and provider identifiers with role labels.
- Escalates with a specific request and confirms the receiving role has taken ownership.

Section 4: Behavioral Interview Answer

Interview question: Tell me about a time you escalated an issue you could not resolve yourself.

Situation: In Ticket 2 of my simulated Help Desk Resolution Portfolio, a provider reported that Epic Hyperspace would not connect at the start of a clinic session. Until it was fixed, the provider could not open charts.

Task: I was responsible for running the approved client-side checks and documenting them without patient information. I had no authority over Epic build or access configuration, so my stop condition was any finding that pointed beyond the workstation.

Action: I verified the provider's identity under the approved procedure, then checked network connectivity, the account's sign-in status in Microsoft Entra ID, and whether Hyperspace launched for the provider on a second workstation. The account was healthy and the symptom followed the provider, which pointed to build-side configuration. I told the provider what I had ruled out and what would happen next, wrote the ticket using role labels only, and warm-transferred it to the application team with the completed checks, the unresolved finding, and a specific request.

Result: The application team confirmed ownership and the ticket was recorded as Escalated. They did not need to repeat my checks. What I learned: an escalation backed by evidence is a completed Tier 1 outcome, so I now write the handoff summary as I work.

Disclosure: Sections 3 and 4 describe simulated training scenarios, not production healthcare employment. Section 2 describes prior non-healthcare IT support work.
